ECCENTRIC ACADEMY

Nigeria's Premier Ethical Hacking & Web Development School

From Zero to Ethical Hacker 🚀

11	**3**	**8+**
Structured Phases	Skill Levels	Real Projects

📱 **@eccentricacademy**
WhatsApp: 09136823282 | 09035505885

💬 A MESSAGE JUST FOR YOU

Read this before anything else — it matters

You do NOT need to be a tech person to start this journey.

A lot of people see words like "ethical hacking" or "web development" and immediately think — that one is not for me. But ask yourself:
Before you learned WhatsApp, did you know anything about smartphones?
Before you learned to drive, did you know anything about engines?

No. You learned. And now it is completely normal to you.

That is exactly what happens here. We start from absolute ZERO. We teach in plain everyday language — no grammar, no jargon, no forming. By the time you finish, you will be doing things that shock your friends and family. 😄

What makes Eccentric Academy different? 🤔

- → We teach in relatable Naija English — like chatting with a friend
- → We use examples you already know: GTBank, MTN, JAMB, WhatsApp
- → Every lesson connects directly to real projects you can show anyone
- → No one will laugh at your questions — ever. Ask away freely
- → Online classes via Zoom/WhatsApp + recordings to rewatch anytime
- → Active WhatsApp support group — get answers 24/7
- → Your instructor has real, working, deployed projects to prove everything
- → We care about your success more than your money. Period.

📋 CURRICULUM OVERVIEW

Your complete learning journey at a glance

The academy is divided into 3 programmes. Each builds on the last:

🌱 PROGRAMME 1: Cybersecurity for Complete Beginners

Zero to Ethical Hacker — 11 Phases of structured, hands-on learning

Phase 0A: Cybersecurity Overview → Phase 0B: Digital & Computer Foundations → Phase 1: Networking → Phase 2: Linux → Phase 3: Security Fundamentals → Phase 4: Web Technology → Phase 5: Web Application Hacking → Phase 6: Recon & OSINT → Phase 7: Tools Mastery → Phase 8: System & Network Attacks → Phase 9: Defensive Security → Phase 10: Career & Portfolio

🔥 PROGRAMME 2: Cisco Introduction to Cybersecurity

Industry-standard cybersecurity curriculum (5 Modules, globally recognised content)

Module 1: The World of Cybersecurity → Module 2: Attacks, Concepts & Techniques → Module 3: Protecting Your Data & Privacy → Module 4: Protecting the Organization → Module 5: Will Your Future Be in Cybersecurity?

⚡ PROGRAMME 3: Web Development with Django

Build real, secure web applications from scratch using Python and Django

HTML/CSS Foundations → Python Basics → Django Framework → Databases & APIs → Security-First Development → Full Project Deployments

🌱 PROGRAMME 1: CYBERSECURITY FOR COMPLETE BEGINNERS

From Zero to Ethical Hacker — 11 Phases of hands-on learning

🎯 Goal of this Programme:
To take ANY person — whether you have never touched a computer before or you already use tech a little — and transform you step by step into a confident, job-ready ethical hacker with real skills and a real portfolio.

- → Strong technical foundations
- → Real-world hands-on labs
- → Portfolio-ready proof of skills
- → Ethical mindset & legal awareness
- → Ability to earn from day one of graduation
- → Confidence to work with real clients

PHASE 0A 🔰 CYBERSECURITY OVERVIEW

Understand the world you are entering — what it is, who does it, and why it matters

◆ Module 0.1 — Introduction to Cybersecurity

- What cybersecurity actually means in simple everyday language
- Why cybersecurity is one of the most important jobs in the world right now
- How Nigerian companies, banks, and government agencies get attacked daily
- The difference between the internet, dark web, and deep web — explained simply

◆ Module 0.2 — Ethical Hacking: Overview

- What is ethical hacking? The legal version of 'breaking in'
- How companies hire ethical hackers to find their own weaknesses before bad guys do
- Real earning potential: bug bounties, freelance pentesting, corporate security roles
- Stories of Nigerian ethical hackers making income in dollars from their bedrooms

◆ Module 0.3 — Ethical Hacking: Key Terminologies

- Vulnerability, exploit, payload, malware, firewall, encryption — all explained simply
- 'What is a zero-day?' (Hint: it's not about time. It's about secrets nobody knows yet)
- Pentest vs. hacking vs. cybercrime — knowing the legal line you must never cross
- Building your cybersecurity vocabulary so you can speak confidently in any tech room

◆ Module 0.4 — Ethical Hacking: Skills You Need

- The mindset of a hacker: curious, patient, creative, persistent
- Technical skills vs. soft skills — why communication is as important as coding
- How to think like an attacker and a defender at the same time
- Self-learning habits that will serve you for your entire career

◆ Module 0.5 — Ethical Hacking: Tools & Software

- Overview of the tools professional ethical hackers use every day
- Kali Linux: the operating system built specifically for ethical hackers

- Metasploit, Nmap, Burp Suite, Wireshark — what each one does in plain terms
- Setting up your first hacking lab at home: free, safe, legal, and powerful

PHASE 0B 💻 DIGITAL & COMPUTER FOUNDATIONS

CRITICAL — do not skip this. This is where the journey truly begins for non-tech students

◆ Module 0B.1 — Computer Basics

- What is a computer? CPU, RAM, hard drive — explained using a 'brain, memory, filing cabinet' analogy
- What is an operating system? Think of it as the 'manager' of your computer
- Files, folders, and file types — why .exe is dangerous and .pdf can be safe (or not)
- How to navigate a computer confidently for the first time — live walkthrough
- Keyboard shortcuts, task manager, and basic troubleshooting every person should know

◆ Module 0B.2 — Internet Fundamentals

- How the internet actually works: routers, servers, data packets — using a 'post office' analogy
- What is an IP address? Think of it as your device's home address on the internet
- DNS: the internet's phone book — and why attackers love to mess with it
- HTTP vs. HTTPS: why the 'S' means your data is encrypted in transit
- What happens when you click a link: a step-by-step breakdown anyone can follow

◆ Module 0B.3 — Command Line Basics

- What is a terminal/command line? It is the computer's 'secret control room'
- Basic Windows Command Prompt AND Linux terminal commands — both covered
- Navigating folders, creating files, and running programs from the command line
- Why hackers prefer the command line: speed, power, and things no GUI can do
- Your first practical task: complete 10 real command-line challenges

PHASE 1 🌐 NETWORKING FUNDAMENTALS

If you do not understand networks, you cannot hack. This is the backbone of everything.

◆ Module 1.1 — Networking Basics

- What is a network? How devices talk to each other — like neighbours sharing a water source
- LAN, WAN, MAN — different sizes of networks and where you find them in real life
- MAC addresses vs. IP addresses: permanent name vs. current location
- Routers, switches, modems, and access points — what each device actually does
- Subnetting basics: how large networks are divided into smaller, manageable pieces

◆ Module 1.2 — TCP/IP Deep Dive

- What is TCP/IP? The language every device on earth uses to communicate
- The 4-layer model explained: Application, Transport, Internet, Network Access

- Ports: like apartment numbers in a building — which ones are important for hackers?
- The 3-way handshake: how two computers say 'hello' before sharing data
- Packet analysis: reading the raw data traveling across a network with Wireshark

◆ Module 1.3 — Network Tools (Hands-on Lab)

- Nmap: scan any network and see every device, open port, and service — with live demo
- Wireshark: capture and read real network traffic flowing through your WiFi
- Ping, traceroute, netstat — the basic tools every network professional uses daily
- Lab: Map a network, identify devices, find open ports, and document your findings

PHASE 2 🐧 LINUX FOR HACKERS

Linux is a hacker's home. Mastering it separates amateurs from professionals.

◆ Module 2.1 — Linux OS Mastery

- Why do hackers use Linux? Speed, control, customisation, and tools unavailable on Windows
- Installing and navigating Kali Linux — the world's most popular hacking OS
- File system structure: why /etc, /var, /home matter to both admins and attackers
- User accounts, permissions, and root access — who can do what, and how to escalate
- Installing software, updating the system, and managing packages with apt

◆ Module 2.2 — Linux Commands for Hackers

- 50+ essential Linux commands every ethical hacker must know — with real practice
- Bash scripting: automate repetitive tasks and write your first security script
- File manipulation: find, grep, awk, sed — search through logs like a forensics expert
- Network commands from Linux: ifconfig, netstat, curl, wget, ssh, nmap — all hands-on
- Lab challenge: Complete a set of Linux tasks that simulate real-world hacker scenarios

PHASE 3 🔐 SECURITY FUNDAMENTALS

Ethical hackers defend by understanding offense. Learn both sides deeply.

◆ Module 3.1 — Cybersecurity Basics (Cisco Curriculum Integrated)

- Types of data that attackers want: personal, financial, medical, corporate — and why
- The CIA triad: Confidentiality, Integrity, Availability — the three pillars of security
- Security vulnerabilities: hardware flaws, software bugs, and human error (the biggest one)
- Organisational security: why companies fail at security even with expensive tools
- Real Nigerian examples: bank breaches, telecom fraud, government data leaks

◆ Module 3.2 — Ethical Hacking Principles

- The 5 phases of ethical hacking: Reconnaissance, Scanning, Exploitation, Post-Exploitation, Reporting
- Rules of engagement: what you must have in writing before touching any system
- Types of penetration tests: black box, white box, grey box — when to use each
- Legal boundaries in Nigeria: what is allowed, what is not, and what can land you in jail
- Writing a proper scope-of-work document before any pentest engagement

PHASE 4 🕸 WEB TECHNOLOGY FUNDAMENTALS

Most attacks today are web-based. You must understand websites from the inside out.

◆ Module 4.1 — How Websites Work

- The client-server model: your browser is the client, websites live on servers far away
- Front-end vs. back-end: what you see vs. what makes it work — using a restaurant analogy
- HTML, CSS, and JavaScript: the three languages every website is built with
- Cookies, sessions, and local storage: how websites remember who you are
- Web hosting, domain names, CDNs — the infrastructure behind every website you visit

◆ Module 4.2 — HTTP in Depth

- HTTP request and response anatomy: headers, body, status codes, methods (GET, POST, PUT, DELETE)
- Authentication mechanisms: how login systems work under the hood
- Cookies vs. tokens vs. sessions — and why each can be attacked differently
- HTTPS and TLS: how encryption protects data in transit (and how it can still be bypassed)
- Lab: Use Burp Suite to intercept, read, and modify real HTTP traffic between browser and server

PHASE 5 ⚔️ WEB APPLICATION HACKING

THIS IS WHERE CONFIDENCE COMES FROM. The skills that make clients pay serious money.

◆ Module 5.1 — OWASP Top 10 (Deep Dive)

- SQL Injection: tricking a database into giving away ALL its data with one clever input
- Cross-Site Scripting (XSS): injecting malicious code into innocent websites — live demo
- Broken Authentication: how weak login systems let attackers take over any account
- Insecure Direct Object Reference (IDOR): accessing other users' files just by changing a number in the URL
- Security Misconfiguration: how a single wrong server setting can expose an entire company
- Using Burp Suite end-to-end: spider, scanner, repeater, intruder — full workflow

◆ Module 5.2 — Hands-on Web Hacking Labs

- Lab 1: Perform a full SQL injection attack on a practice target — extract a database
- Lab 2: Find and exploit an XSS vulnerability — steal a session cookie
- Lab 3: Bypass a login page using authentication vulnerabilities
- Lab 4: Exploit an IDOR vulnerability to access another user's private data
- Lab 5: Write a professional vulnerability report documenting your findings — like a real pentest

PHASE 6 🔍 RECONNAISSANCE & ENUMERATION

Information is power. Hackers spend 70% of their time here — before touching anything.

◆ Passive Reconnaissance (Looking Without Touching)

- OSINT: Open Source Intelligence — finding everything about a target using only public information
- Google Dorking: using advanced search operators to find hidden files, login pages, and vulnerabilities
- WHOIS lookups, DNS enumeration, and finding subdomains of a target company
- Shodan: the 'Google for hackers' that shows internet-connected devices worldwide
- Social media OSINT: what attackers learn about companies from Instagram, LinkedIn, and Twitter

◆ Active Reconnaissance (Touching the Target)

- Port scanning and service enumeration with Nmap — aggressive scans, OS detection
- Banner grabbing: identifying software versions running on a server (and finding known exploits)
- Directory and file enumeration: finding hidden pages on websites with Gobuster/Dirb
- User enumeration: finding valid usernames on login pages and email servers
- Lab: Full recon report on a legal target — document everything like a professional spy

PHASE 7 🛠️ TOOLS MASTERY

Tools don't make hackers — understanding does. But knowing your tools deeply is non-negotiable.

◆ Core Hacking Tools — Deep Mastery

- Metasploit Framework: the world's most powerful exploitation platform — from basics to advanced
- Burp Suite Pro: the definitive web application hacking tool — every feature covered
- Nmap & Nessus: network scanning and automated vulnerability detection
- Hydra & Hashcat: password cracking — dictionary attacks, brute force, and rainbow tables
- Aircrack-ng: WiFi security testing — how WPA2 networks can be cracked and secured

◆ Python Scripting for Hackers

- Writing custom port scanners, password checkers, and network sniffers in Python
- Automating repetitive security tasks so you work 10x faster than manual testers
- Building your own exploitation scripts when no existing tool fits the job
- Web scraping and OSINT automation: collect data at scale without clicking anything manually
- Lab: Build and submit 3 original Python security tools for your portfolio

PHASE 8 💥 SYSTEM & NETWORK ATTACKS

Understand the most damaging attacks on computers and networks — from the inside.

◆ System Exploitation

- Buffer overflow attacks: what they are and how one small coding mistake crashes an entire system
- Privilege escalation: going from a low-level user to full admin control of a system
- RAT (Remote Access Trojan): how it works, how it hides, and how to detect and remove it
- Ransomware: the anatomy of an attack from entry point to encryption to ransom demand
- Keyloggers and spyware: how they silently record everything and how to find them

◆ Network Attacks

- Man-in-the-Middle (MITM): intercepting communication between two parties without their knowledge
- ARP poisoning: tricking network devices into sending traffic through your machine
- Denial of Service (DoS) and DDoS: overwhelming a service until it collapses
- DNS Spoofing: redirecting users to fake websites by poisoning their DNS cache
- Advanced Persistent Threats (APT): the long-game attacks used against corporations and governments

PHASE 9 🛡️ DEFENSIVE SECURITY — BLUE TEAM

This makes Eccentric Academy unique. Most hacking courses never teach you how to DEFEND. We do.

◆ Security Devices & Technologies (Cisco Module 4 Integrated)

- Firewalls: how they work, types of firewalls, and how attackers bypass poorly configured ones
- IDS and IPS: Intrusion Detection and Prevention Systems — your digital security guards
- SIEM systems: collecting and analysing logs to detect attacks in real time
- Endpoint protection: antivirus, EDR, and why some malware laughs at all of them
- Network segmentation: splitting your network so attackers cannot move freely if they get in

◆ Incident Response & Forensics

- What to do in the first 60 minutes when your organisation is attacked
- Digital forensics basics: recovering deleted files, analysing memory dumps, reading event logs

- Malware analysis: how to examine a suspicious file safely without infecting your own machine
- Writing an incident report that management and lawyers can understand
- Lab: Red Team vs. Blue Team simulation — one group attacks, the other detects and responds

PHASE 10 💼 CAREER, PORTFOLIO & FREELANCING

This is where most academies fail you. We won't. Your skills must become income.

◆ Building Your Professional Portfolio

- How to document and present every project you built in this programme for employers
- GitHub profile setup: make your code visible and attractive to hiring managers
- Personal cybersecurity website: your 24/7 resume that speaks even when you are asleep
- LinkedIn optimization for cybersecurity roles: what recruiters actually look for
- Writing a professional penetration test report that clients and managers will pay for

◆ Earning From Your Skills

- Bug bounty hunting: HackerOne, Bugcrowd, and Nigerian company programmes — how to get started
- How to price your freelance pentesting services to Nigerian SMEs and fintech companies
- Cold outreach: how to contact companies, offer your services, and land your first paid client
- Remote work: how Nigerian ethical hackers earn in US dollars without leaving their bedroom
- Your first 90 days after graduation: a practical action plan with weekly milestones

🎓 PROGRAMME 2: CISCO INTRODUCTION TO CYBERSECURITY

Industry-standard curriculum — globally recognised, locally delivered

This programme follows the official Cisco Networking Academy 'Introduction to Cybersecurity' course, delivered by your instructor with added Nigerian context, real-world examples, and hands-on labs not found in the original course. This is the same content used by cybersecurity professionals worldwide.

MODULE 1 🌍 THE WORLD OF CYBERSECURITY

Understand the cybersecurity landscape, your data, and what attackers really want

◆ 1.1 — The World of Cybersecurity

- 1.1.1 What is Cybersecurity? — the global war happening right now on your devices
- 1.1.2 Protecting Your Personal Data — what is at risk every time you go online
- 1.1.3 Your Online Identity — the difference between who you are and who you appear to be online
- 1.1.4 Your Data — where it goes, who collects it, and how it is used against you
- 1.1.5 Where Is Your Data? — it is stored in places you have never visited
- 1.1.6 What's More... — emerging threats you must know about
- 1.1.7 Smart Devices — your phone, TV, and fridge are all security risks
- 1.1.8 What Do Hackers Want? — money, data, disruption, and revenge
- 1.1.9 Identity Theft — how Nigerians lose their identities online every day
- 1.1.10 Who Else Wants Your Data? — corporations, governments, and advertisers

◆ 1.2 — Organisational Data

- 1.2.1 Types of Organisational Data — what companies collect and why it is valuable
- 1.2.2 The Cube — a framework for thinking about information security systematically
- 1.2.3–1.2.4 Real-world case studies: Is This For Real?
- 1.2.5 Data Security Breaches — what actually happens when a company gets hacked
- 1.2.6 Consequences of a Security Breach — fines, lawsuits, reputation damage, and jail time

◆ 1.3 & 1.4 — Threats & Cyber Attackers

- 1.3 Cyber Threats — malware, ransomware, phishing, insider threats, and nation-state attacks
- 1.4.1 Types of Attackers — script kiddies, hacktivists, organised crime, nation states
- 1.4.2 What Colour Is My Hat? — white hat, black hat, grey hat explained
- 1.4.3 Internal vs. External Threats — the enemy is sometimes already inside
- Quiz and comprehension check

MODULE 2 ⚡ ATTACKS, CONCEPTS & TECHNIQUES

Deep dive into how real cyber attacks work — from malware to advanced persistent threats

◆ 2.1 — Analysing a Cyber Attack

- 2.1.1 Types of Malware — viruses, worms, trojans, ransomware, spyware, adware
- 2.1.2 Symptoms of Malware — how to know your device has been compromised
- 2.1.3 Real-world case study and analysis exercise

◆ 2.2 — Methods of Infiltration

- 2.2.1 Social Engineering — manipulating human psychology to bypass all technical security
- 2.2.2 Denial-of-Service (DoS) — flooding a service until it collapses
- 2.2.3 Distributed DoS (DDoS) — same attack, but from thousands of machines at once
- 2.2.4 Botnet — your infected device is probably already part of one
- 2.2.5 On-Path Attacks — intercepting and modifying communication in real time
- 2.2.6 SEO Poisoning — how attackers manipulate Google to push malicious sites to the top
- 2.2.7 Wi-Fi Password Cracking — live demonstration on a test network
- 2.2.8 Password Attacks — dictionary, brute force, credential stuffing, and spraying
- 2.2.9 Cracking Times — how long it actually takes to crack different passwords
- 2.2.10 Advanced Persistent Threats — the attacks that hide inside companies for months or years

◆ 2.3 & 2.4 — Vulnerabilities & Cryptojacking

- 2.3.1 Hardware Vulnerabilities — attacks that target the physical chips in your device
- 2.3.2–2.3.3 Software Vulnerabilities and how to categorise them
- 2.3.4 Software Updates — why running old software is one of the biggest security mistakes
- 2.4.1 Cryptocurrency — how it works and why hackers love it
- 2.4.2 Cryptojacking — how attackers secretly mine crypto using YOUR computer's power
- Module 2 Quiz

MODULE 3 🔒 PROTECTING YOUR DATA & PRIVACY

Take full control of your digital life — learn to defend what matters most

◆ 3.1 — Protecting Your Devices & Network

- 3.1.2 Protecting Your Computing Devices — practical steps everyone should take today
- 3.1.3 Wireless Network Security at Home — your home WiFi is probably vulnerable right now
- 3.1.4 Public Wi-Fi Risks — why you should never bank on a café's WiFi without a VPN
- 3.1.5–3.1.7 Password Security, Strong Passwords, and Using Passphrases
- 3.1.8–3.1.9 Password Guidelines and live password strength checking

◆ 3.2 — Data Maintenance

- 3.2.1 What Is Encryption? — how your data becomes unreadable to everyone except the right person
- 3.2.2 How Do You Encrypt Your Data? — practical tools and methods for everyday people
- 3.2.3 Back Up Your Data — the 3-2-1 backup rule explained and implemented
- 3.2.4 Are They Really Gone? — why 'deleted' files are often still recoverable
- 3.2.5 How to Delete Data Permanently — tools and methods that actually work

◆ 3.3 & 3.4 — Privacy & Online Safety

- 3.3.1–3.3.7 Who Owns Your Data? Terms of Service, Privacy Settings, and what you actually agreed to
- 3.4.1 Two-Factor Authentication — why every account needs this turned on immediately
- 3.4.2 Open Authorization (OAuth) — how 'Login with Google' works and its risks
- 3.4.3 Social Sharing — what you post online is never truly private
- 3.4.4 Don't Get Spoofed — recognising fake caller IDs, emails, and websites
- 3.4.5 Email and Web Browser Privacy — settings everyone should change right now

◆ 3.5 — Real-World Scenario Practice

- 6 interactive scenarios: spot the risky behaviour in each realistic situation
- Personal risk audit: assess your own current online security habits honestly
- Action plan: what to change TODAY to dramatically improve your personal security

MODULE 4 🏢 PROTECTING THE ORGANISATION

How companies defend themselves — and how you become the person who helps them do it

◆ 4.1 — Cybersecurity Devices & Technologies

- 4.1.1–4.1.2 Security Appliances — the hardware that protects corporate networks
- 4.1.3–4.1.4 Firewalls — types, how they work, and how to configure them
- 4.1.5–4.1.6 Port Scanning — seeing exactly what a company's network looks like from outside
- 4.1.7 Intrusion Detection and Prevention Systems — automated sentinels watching your network 24/7
- 4.1.8 Real-Time Detection — catching attacks as they happen, not after the damage is done
- 4.1.9 Protecting Against Malware — endpoint security strategies that actually work
- 4.1.10 Security Best Practices — the 20% of actions that prevent 80% of all attacks

◆ 4.2 — Behaviour-Based Security & Risk Management

- 4.2.1 Behaviour-Based Security — detecting attackers by noticing abnormal activity patterns
- 4.2.2 NetFlow — analysing network traffic to find hidden threats
- 4.2.3 Penetration Testing — why companies pay ethical hackers to attack them

- 4.2.4 Hands-on practical: conduct a mini pentest on a provided test system
- 4.2.5 Impact Reduction — minimising damage when an attack cannot be fully prevented
- 4.2.6 What Is Risk Management? — how organisations decide which security investments to make

MODULE 5 🌟 **YOUR FUTURE IN CYBERSECURITY**

The roadmap from student to professional — and every opportunity waiting for you

◆ 5.1 — Legal & Ethical Issues

- Cybersecurity laws in Nigeria and globally — what is protected and what is prosecuted
- The Computer Misuse Act and similar legislation: knowing the exact lines you must not cross
- Professional ethics: what happens to a career when trust is broken
- Case studies: ethical hackers who crossed the line — and the consequences

◆ 5.2 — Education & Careers

- 5.2.1 How to Become a Cybersecurity Guru — the learning path beyond this academy
- 5.2.2 Professional Certifications — CEH, OSCP, CompTIA Security+, and which to pursue first
- 5.2.3 Cybersecurity Career Pathways — penetration tester, SOC analyst, threat hunter, CISO
- Salary ranges for cybersecurity roles in Nigeria and in remote international positions
- How to break in with no prior experience: the portfolio-first strategy that works

🏗️ PROGRAMME 3: WEB DEVELOPMENT WITH DJANGO

Build real, secure web applications from absolute scratch

Django is used by Instagram, Pinterest, and The Washington Post. When you learn Django, you are using the same tools that power some of the biggest websites in the world. Nigerian companies are actively hiring Django developers — and paying very well for developers who also understand security.

TRACK 1 🎨 FRONT-END FOUNDATIONS

Build beautiful, functional interfaces — the face of every application

◆ HTML — The Structure of Every Website

- What is HTML? The bones of every webpage — without it, nothing exists
- Tags, attributes, and elements: the building blocks used by every website on earth
- Building forms, tables, lists, images, and links — all the essential components
- Semantic HTML: writing code that is clean, accessible, and professional
- Project: Build your first personal profile webpage from a blank file

◆ CSS — Making It Beautiful

- What is CSS? The clothes, paint, and decoration that makes websites attractive
- Colours, fonts, spacing, and layouts — make any design come to life
- Flexbox and Grid: the modern way to arrange elements on a page
- Responsive design: making your website look great on both phones and laptops
- Project: Style your profile page to look like a real, professional portfolio

◆ JavaScript Basics

- What is JavaScript? The brain that makes websites interactive and dynamic
- Variables, functions, loops, and conditions — the fundamentals in plain language
- DOM manipulation: change any part of a webpage with code while the user is on it
- Form validation: check user input before it ever reaches the server
- Project: Add interactive features to your profile page

TRACK 2 🐍 PYTHON & DJANGO BACK-END

The engine that powers everything — where the real work happens

◆ Python Fundamentals

- Why Python? It reads almost like English: 'if balance < 0: print Sorry'
- Data types, variables, lists, dictionaries — the containers that hold all your data
- Functions and classes: writing reusable, organised, professional code
- File handling, error handling, and working with external APIs
- Project: Build a command-line security tool in Python

◆ Django Framework — Building Real Web Apps

- What is Django? A 'website factory' — it gives you everything you need already built
- The MVT pattern: Models (data), Views (logic), Templates (display) — the Django way
- Building user registration and login systems with proper password hashing
- Database design with PostgreSQL — how to structure data for any kind of application
- REST APIs: the bridge between your website and mobile apps
- Security-first development: CSRF protection, SQL injection prevention, XSS defence — built in from day one

◆ Deployment & DevOps Basics

- How to put your website on the internet so the world can see it
- Environment variables: keeping secrets (passwords, API keys) out of your code
- Basic server administration: Linux, Nginx, Gunicorn — making your app production-ready
- Version control with Git: the professional way to manage and share your code
- Project: Deploy a fully working web application with a real URL

🚀 ECCENTRIC ACADEMY SIGNATURE PROJECTS

Real projects built by your instructor — proof that everything taught here actually WORKS

These are not imaginary examples. Every project below is real, deployed, and was built by your instructor. Some are tools actively used by people. Some have attracted real business interest. When you enroll, you will see these projects, learn from them, and in many cases — build your own version.

🏠 Secure Real Estate Platform *[All Levels]*

A complete property listing and management platform — like Propertymart.ng, but built from scratch with serious security baked in. Users can list properties, search by location, contact agents, and manage their listings. The security layer prevents SQL injection, unauthorised access, and fake listings.

What You Build:

- → Full real estate web app with user login and admin dashboard
- → Property search, filter, and image upload functionality
- → Role-based access control: buyers, agents, and admins all see different things
- → Full security audit report documenting all vulnerabilities found and fixed

> **Naija Take:** *Real estate fraud is one of the biggest online crimes in Nigeria. This platform was built to protect buyers and sellers. Three real estate companies have already expressed interest in licensing it.*

📖 Online Bible Study Academy *[Beginner → Intermediate]*

A full learning management system (LMS) built for a church/bible study community. Students register, access video lessons, take quizzes, track their progress, and receive completion badges. Admins upload content and manage students. Think of it as a mini Udemy — built entirely from scratch.

What You Build:

- → E-learning platform with video lessons, quizzes, and progress tracking
- → Student registration with email verification
- → Admin content management panel — upload and organise any type of content
- → Automated quiz grading and certificate generation

> **Naija Take:** *This came from a real church community that wanted to take their bible study online. It is currently being used by real students. When a project serves real people, the learning behind it is also real.*

🎓 Eccentric Academy Platform *[Advanced]*

The full tech platform that runs this very academy. A complete, secure, production-grade LMS with student enrollment, course delivery, project submissions, instructor

dashboards, payment integration with Paystack, and a community discussion forum. Advanced students contribute real code to the live platform.

What You Build:

- → Production LMS with full user management, course modules, and payments
- → File submission system for project assignments with instructor feedback
- → Discussion forum for student community and Q&A
- → Complete security audit — students find and fix real vulnerabilities in a live app

Naija Take: *How many academies can say their students helped build the platform they are learning on? Advanced students contribute real code to Eccentric Academy — your work is not practice. It is real.*

🛡️ ScamShield — Nigerian Anti-Scam Tool *[Intermediate]*

A web-based tool that helps ordinary Nigerians identify suspicious links, messages, and websites. Paste in any suspicious URL or message and ScamShield analyses it for red flags: fake domains, known phishing patterns, manipulation language, and more. Built as a public service for non-tech people.

What You Build:

- → Web app where users paste suspicious messages or links for instant analysis
- → Pattern matching engine for common Nigerian scam formats (BVN fraud, fake JAMB, etc.)
- → Visual risk report: 'This looks like a phishing attempt — here is why'
- → API endpoint so other apps can integrate the scam detection engine

Naija Take: *This tool has already helped real people avoid being scammed. When a project protects actual human beings, that is what meaningful tech feels like. Intermediate students build their own version as their capstone.*

📍 Location & Device Tracker via Media Files *[Advanced]*

A highly sophisticated OSINT and security research tool that demonstrates how an attacker can silently extract the GPS coordinates, device type, operating system, browser details, and approximate location of a person who clicks a link or opens an image or video sent via social media. Built entirely for defensive security education and awareness training.

What You Build:

- → Send a specially crafted image, video, or link via WhatsApp, Instagram DMs, or Telegram
- → The moment the target opens the file or clicks the link, their device details are logged
- → Captured data: GPS coordinates, IP address, device model, OS version, browser, screen resolution
- → Full dashboard showing all captured information with map integration
- → Detection and defence module: how to prevent your own device from being tracked this way

Naija Take: *This is one of the most eye-opening demonstrations in the academy. When*

students see their own location appear on the instructor's screen after clicking an innocent-looking image — the lesson about digital footprints becomes unforgettable forever. This is taught ONLY as a defensive awareness tool.

🤖 RAT — Remote Access Trojan (Lab Only) *[Advanced]*

A Remote Access Trojan built in a completely isolated lab environment purely for educational analysis. Students write, analyse, and dissect this malware to understand exactly how it works at the code level — which connections it makes, how it hides itself, what data it accesses. This knowledge is what enables real defence.

What You Build:

- → Functional RAT in offline, sandboxed lab demonstrating remote control and keylogging
- → Network traffic analysis: see exactly what data the RAT sends home
- → Persistence mechanisms: how malware survives a reboot — and how to remove it permanently
- → Full detection and removal lab: find the RAT, kill it, and clean the system

Naija Take: *A RAT on your phone is worse than someone stealing it. A thief gets what was there at that moment. A RAT gives ongoing access forever — unless you know how to stop it. And now you will.*

💀 Ransomware Simulation (Lab Only) *[Advanced]*

A ransomware simulation in a fully isolated, offline environment. Students build a simplified version to understand encryption mechanics, file targeting, and command-and-control communication. This knowledge is the foundation of ransomware defence, incident response, and recovery planning.

What You Build:

- → Simulated ransomware that encrypts files in a test folder and displays ransom message
- → Decryption key management: understand how attackers control the unlock mechanism
- → Network isolation techniques: stop ransomware spreading across an organisation's network
- → Recovery lab: restore encrypted files using proper backup and decryption procedures

Naija Take: *Companies pay incident response teams enormous fees when ransomware hits. Knowing this from the inside makes you the person they call. That is the career this project opens up for you.*

🧾 Fake Receipt Generator *[Intermediate]*

A developer tool that generates realistic-looking test receipts for software testing purposes. Banks and fintech companies use tools like this to populate test environments with fake transaction data — so they can test how their apps behave without using real customer data.

What You Build:

- → Generate customisable test receipts: name, amount, date, transaction ID, bank logo
- → Multiple receipt formats: mobile bank alerts, POS receipts, online transfer confirmations
- → Batch generation API for populating large test datasets quickly
- → Fraud detection module: how to spot a fake receipt using digital forensics

Naija Take: *This project perfectly illustrates how the same technical skill can protect or harm. We teach it so you understand both sides — and so you can recognise when tools like this are being misused to deceive people.*

💰 PRICING & PAYMENT PLANS

Investing in yourself is the best investment you will ever make

All prices include flexible payment plans. No hidden charges. No surprises. Just clear, honest pricing designed to be accessible for every Nigerian student.

🌱

BEGINNER LEVEL

₦45,000

3 Months | 12 Weeks

Zero tech experience needed — absolute beginners welcome

- → 12 weeks of beginner-friendly live classes
- → 2 classes per week via Zoom or WhatsApp Video
- → All class recordings — rewatch anytime, forever
- → WhatsApp support group — ask questions 24/7
- → Hands-on project: personal portfolio website
- → Phishing awareness project to protect yourself and others
- → Warm, supportive community of fellow learners
- → Completion card and progress tracking
- → ————————————————
- → PAYMENT PLAN: ₦15,000/month × 3 months

🔥

INTERMEDIATE LEVEL

₦85,000

4 Months | 16 Weeks

For those ready to build real skills and a real portfolio

- → Everything in Beginner PLUS:
- → 16 weeks of hands-on, deep-dive training
- → 3 live classes + 1 practical lab session per week
- → Access to live hacking lab environment (CTF challenges)
- → All class recordings — lifetime access
- → Build 2 complete portfolio projects
- → ScamShield capstone project

→ Location Tracker awareness demo and defence module
→ Introduction to bug bounty earning
→ Professional pentest report template
→ ————————————————
→ PAYMENT PLAN: ₦25,000/month × 4 OR ₦45,000 × 2
→ LOYALTY DISCOUNT: Beginner graduates pay ₦70,000

⚡

ADVANCED LEVEL

₦150,000

5 Months | 20 Weeks

For those who want to become true experts and earn seriously

→ Everything in Intermediate PLUS:
→ 20 weeks of expert-level real-world training
→ 3 classes + 2 lab sessions per week
→ Unlimited lab access for 6 months
→ Bi-weekly 1-on-1 mentorship with the instructor
→ Full access to ALL instructor project source codes
→ RAT, Ransomware & Location Tracker lab projects
→ Red Team vs. Blue Team live simulation exercises
→ Capstone: full security audit of Eccentric Academy platform
→ Career guidance: bug bounties, freelancing, job placement
→ CV review, LinkedIn optimisation, portfolio presentation coaching
→ ————————————————
→ PAYMENT PLAN: ₦35,000/month × 5 OR ₦80,000 × 2
→ LOYALTY DISCOUNT: Intermediate graduates pay ₦120,000

🎁 Special Offers — Because We Genuinely Want You Here

🐣 Early Bird (First 20 students):
20% off any level. First 20 students to enroll pay significantly less. Do not wait.

👫 Refer a Friend:
Bring a friend and get ₦5,000 off your next payment. You both benefit.

👩 Women in Tech:
All female students receive 15% off any level. We actively want more women in cybersecurity.

🎓 NYSC / Student Discount:
Show your valid school ID or NYSC call-up letter and get 10% off immediately.

📦 Full Bundle (All 3 Levels):
Pay for all 3 levels together and pay only ₦230,000 — saving ₦50,000.

🏢 Corporate / Group Booking:
5 or more people from the same company? Get 30% group discount on any level.

❤️ A FINAL WORD FROM US

This is the most important part of this whole document

We built Eccentric Academy because too many talented Nigerians are being left behind.

Not because they are not smart enough. Not because they cannot do it. But because nobody explained it to them in a language they could understand, with examples from their own lives, in a place that felt safe to ask questions and make mistakes.

Every day, Nigerians lose money to online scams that a little knowledge could have prevented. Every day, brilliant young people finish university without a single skill that Nigerian or international companies will pay for. Every day, companies struggle to find qualified cybersecurity professionals — and pay foreign consultants millions — while the talent is right here, waiting for the right opportunity.

Eccentric Academy is our answer to all of that.

If you join us, we make you these promises:

- → You will never feel stupid here — we explain until it clicks
- → You will never be left alone — our community is always active
- → You will build real things — not just watch videos and forget
- → You will finish with skills that can transform your finances
- → You will leave with a portfolio that speaks for itself
- → You will have a mentor who genuinely cares about your outcome

All we ask is this: show up, ask questions freely, and do the work. The rest, we handle.

Welcome to Eccentric Academy. We are so glad you are here. 🙏
